**Maintenance Procedures for Acid Stained Interior Floor Finishes**

Thank you, for your recent investment in an architecturally finished concrete floor. Concrete floors are very durable and abrasion resistant, however they are not indestructible or maintenance free. With the proper care the floor finishes will last for many years.

During the installation process, the floor was sealed to protect the surface during the balance of the construction. This sealer coat should be considered the foundation for the additional floor wax coats that will become the wearing surface. The floor waxes should be installed before the floor is put into service. The floor wax should be maintained on a regular basis and reapplied as needed as you would with any tile, terrazzo, or wood flooring materials.

Questions regarding the type of waxes to be used for various applications should be directed to any Commercial Janitorial Supply Co. or Johnson Wax Professional® hot line (800) 558-2332. Care should be exercised to verify that the final finish meets all ADA requirements for slip resistance.

---

**Maintenance Procedures**

1. Sweep frequently.
  2. Clean up any spills quickly.
  3. Wet mop and rinse to avoid grit build up.
  4. Wax as needed based on traffic patterns and use.
  5. Check for slip resistance.
